How to put batteries in a laser pointer?
(in a “natural” way)

simplified toy model:

- remember batteries have a + and a - side (for weak electro potential)
- open your pen (turn upper part) & look inside
- you see one electrical contact in the middle
- no contact on the other side in the middle
  => need to take one contact from the side
- batteries are + on top AND at the side !!!!
- so - side needs to touch the inner electrical contact

⇒ there is only one solution (= ok with naturalness)
i.e. + sign up.
